

# BoF: The Virtual Institute for I/O and the IO-500

Julian M. Kunkel, Jay Lofstead, John Bent

German Climate Computing Center, Sandia National Lab, Seagate Government Solutions

2017-06-20

# Outline

- 1 Overview
- 2 Wiki Content
- 3 High-Performance Storage List
- 4 Summary

# Introduction

## Goals of the Virtual Institute for I/O

- Provide a platform for I/O enthusiasts for exchanging information
- Foster training and collaboration in the field of high-performance I/O
- Track and encourage the deployment of large storage systems by hosting information about high-performance storage systems

<https://www.vi4io.org>

# Introduction

## Philosophical cornerstones of the institute

- Treat every member and participant equally
- Allow free participation without any membership fee inclusive to all
- Be independent of vendors and research facilities

# Open Organization

- The organization uses a wiki as central hub
  - Everybody (registered users) can edit the content
  - Mayor changes should be discussed (see below)
  - The wiki uses tag clouds to link between similar entities
- Supported by mailing lists
  - Call-for-papers
  - Announce list for relevant information
  - Contribute list to discuss and steer organizational issues
- Mayor changes should be discussed on the contribute mailing list
- Members can vote for changes

***Everybody is welcome to participate***

# Wiki Content

- Groups involved in high-performance storage  
*Overview of research groups and industry (companies involved in research)*
  - Product development the group is involved in
  - Research projects (with links to their source)
  - Tags for layers, products and knowledge
- Tools: *Overview of relevant tools with small descriptions*
  - Types of tools: analysis, benchmarking, I/O middleware
  - Tags for layers and features
- High-performance storage list (HPSL)  
*Similar to many other lists, e.g., Top500, Graph500*
  - Due to the nature of I/O no simple metric
  - Editable and owned by the community
- Internal section  
*Provides templates and describes rules for editing the page*

# Group Tags

## Layers

- Describe the abstraction level in the file system stack
  - block storage, object storage, file system, middleware, tape, grid, cloud
- You may add a specific software as well (MPIIO, ...)

## Knowledge

- Orthogonal
  - data management, energy-efficiency, machine learning, compression, deduplication, big data, modeling, virtualization, monitoring, simulation
- You may add a specific software as well (GPFS, HPSS, MPICH)

## Products

- Specific software products, e.g., MPICH
- Development of software the group is involved in

# High-Performance Storage List

The HPSL contains system characteristics for sites, supercomputer and storage

## Strategy to overcome certain obstacles

- *Storage systems are heterogeneous*
  - Communicate a system model that fits most use cases
- *Representativeness of a single metric / benchmark*
  - Rely mostly on theoretic values
  - Allow users to utilize any benchmark/app to determine sustained performance
- *Runtime for executing a benchmark*
  - Optional values: a site can publish computers with a subset of values
  - No overhead, since users can use their own benchmark

# System Model

## Components with characteristics

- Site
- Supercomputer
- Storage: shared, local, tape archive

## Navigation

- Components are assigned to sites
- The site topology is visualized

Examples: <http://www.vi4io.org/hpsl/2017/de/dkrz/start>

<http://www.vi4io.org/hpsl/2017/jp/jamstec/start>

# Collected Information

## Peak Performance

- Theoretical value based on hardware limits
  - e.g. network (server) throughput, SATA limits
- Best performance of one server x number of servers.
- Describe in the text how the peak is computed

## Sustained Performance

- Actually observed performance with an application or benchmark
- You can use any benchmark and measurement protocol
- Just make sure you are not measuring cache effects
- Describe in the text how the value has been measured

# Collected Information

## Tags

- Describe hardware and software features individually
- Include coarse grained and fine grained information
  - Lustre, Lustre 2.7, DNE Phase 1
  - Infiniband, FDR-14, fat-tree, blocking 2:2:1
- A taxonomy is needed – but overkill so far
  - Approach: check existing tags and manually fix tag incompatibility

# Tracking Data Across Multiple Years

## Strategy

- Every begin of a year, systems from the last list are copied over
- Decomission: 5 years after installation, systems are removed from the list

## Dealing with hardware upgrades

- Procurement in phases: a small system is delivered first, later a big one
  - If both systems work as one big system, you can first add “NAME phase 1”, then later add the system “NAME”
    - Combine the characteristics
  - If not, then you can keep “NAME phase 1” and “NAME phase 2” systems
- Minor upgrades: e.g., more storage, more compute nodes
  - Just update the system characteristics of this year’s supercomputer
  - Keep the older lists as they are

# HPSL 2017

## Features

- Table view with selectable columns
- Flexible metrics selection/aggregation
- Multi-year analysis will be supported

storage capacity

#	Site		Supercomputer		Storage		
	Name	nationality	Name	memory_capacity	Name	capacity	
			in PFLOPs	in TiB		in PiB	
1	LANL	US	Trinity	11.08	1,919.03	Lustre	72.83

# Some More Analysis: Relationship Storage/Memory Capacity

- 33 sites are in the list
- Correlation storage cap. vs.
  - memory capacity = 0.64
  - compute peak = 0.057
- Mean(storage/mem capacity)  
= 59

# Summary

- The Virtual Institute for I/O is a new community hub
  - Open to everybody and free to join
- It contains information about
  - Tools, benchmarks
  - Research groups
  - Standardization efforts
- It hosts the High-Performance Storage List (HPSL)
  - Covers many metrics and allows flexible visualization
  - Will track metrics across years
  - Can be updated by members

***You are welcome to participate***
